

## Ensure Proper Exposure While On the Shoot

Did you know that the Imaging Module includes a built-in spot meter?

You can quickly check precisely where specific information falls on the histogram with the spot meter.

While shooting, you can make sure that the highlights, mid-tones and shadows all fall correctly on the histogram.

### Check Information on the Histogram

1. In Imaging Module mode, tap on the histogram to make it active.
2. In the upper left-hand corner you will see a picker symbol, tap on this to activate the picker tool.
3. Select a spot on the image that you want to check, then tap that point on the image.
4. A purple circle will appear that is directly linked to the area you selected.
5. On the histogram, a purple line will appear. This is where the information from the selected point is sitting on the histogram.
6. If you scroll forward or backward the selected area will move with each frame, giving you a clear idea of how each exposure change effects where that detail falls.
